

COMPONENT SHORTAGE 2022

CONTEXT

Short on components? More control!

The electronics market is experiencing an unprecedented pressure with a large scale #shortage of components.

Many manufacturers turn to new suppliers that they do not know or are tempted to use old stocks... A hunt for components that can quickly become dangerous for the quality of the process and the deliverables. In order to limit risk and preserve good quality electronic boards, it is therefore life-saving to test the batches purchased and in particular their solderability before launching the production of the boards.

In this situation, the Menisco ST88 NEO solderability tester is a valuable asset for determining the solderability of components: a way to preserve your reputation and customer satisfaction.

Preserve the quality of your deliverables, have the #solderability tester reflex.

THE MENISCO ST88 NEO

This versatile device, whose inventor and historic manufacturer has been Metronelec for more than 40 years, is now in its 8th generation with more and more innovations for all kinds of solderability tests:

- Solder pot module
- Solder globule module
- Highest precision among the competition
- Imaging through two HD cameras
- Nitrogen atmosphere as option
- Easy to use software interface and exportable results using any version of Windows
- Testing according to all international standards
